SEO Audit for thecsrjournal.com

This report grades your website based on the strength of various SEO factors such as On Page Optimization, Off Page Links, Social and more. The overall Grade is on a A+ to F- scale, with most major, industry leading websites in the A range. Improving your grade will generally make your website perform better for users and rank better in search engines. There are recommendations for improving your website at the bottom of the report. Feel free to reach out to us if you'd like us to help with improving your website's SEO!

On-Page SEO Results

Your On-Page SEO could be better

Your page has some level of On-Page SEO optimization but could be improved further. On-Page SEO is important to ensure Search Engines can understand your content appropriately and help it rank for relevant keywords. You should ensure

that HTML Tag Content is completed correctly and align text content to target keywords.

Title Tag

You have a Title Tag, but ideally it should be shortened to between 50 and 60 characters (including spaces).

> The Crime & Society Review | Interdisciplinary Scholarly Journal

Length : 64

Title Tags are very important for search engines to correctly understand and categorize your content.

The Title Tag is an important HTML element that tells users and Search Engines what the topic of the webpage is and the type of keywords the page should rank for. The Title will appear in the Header Bar of a user's browser. It is also one of the most important (and easiest to improve) On-Page SEO factors.

We recommend setting a keyword rich Title between 50–60 characters. This is often simple to enter into your CMS system or may need to be manually set in the header section of the HTML code.

Meta Description Tag

Your page has a Meta Description Tag however, your Meta Description should ideally be between 120 and 160 characters (including spaces).

> An interdisciplinary scholarly rolling-publication journal committed to advancing the systematic, critical, and evidence-informed study of crime, justice, and society through the Rashomon Approach.

Length : 197

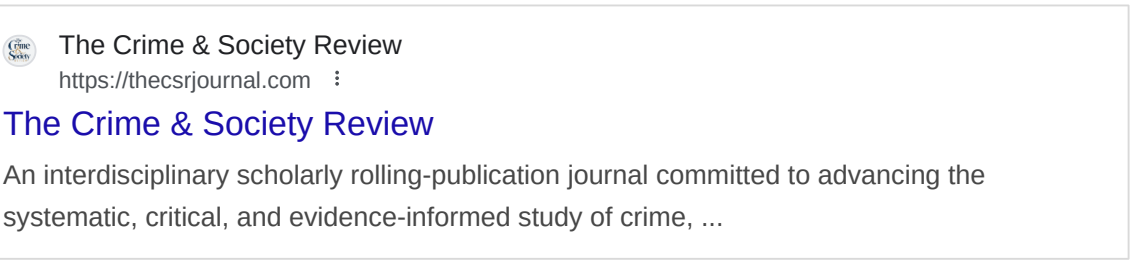

A Meta Description is important for search engines to understand the content of your page, and is often shown as the description text blurb in search results.

Meta Description is another important HTML element that explains more descriptively to Search Engines what your page is about. Meta Descriptions are often used as the text snippets used in Search Engine results (though Search Engines are increasingly generating these themselves) and can help further signal to Search Engines what keywords your page should rank for.

Make sure your page has a Meta Description included, and is at an optimum length (between 120 and 160 characters). Make your Meta Description text interesting and easy to comprehend. Use phrases and keywords relevant to the page and user that you would like to rank for. Meta Description is normally available to be updated in your CMS.

SERP Snippet Preview

This illustrates how your page may appear in Search Results. Note, this is intended as a guide and Search Engines are more frequently generating this content dynamically.

The SERP Snippet illustrates how your page may be shown in Search Results for a particular query. Typically the page's Title, URL and Meta Description have been the main components utilized here, and hence could be carefully dictated, though Search Engines are more frequently building these snippets themselves to better represent the page content to their searchers.

It's important that the SERP Snippet is enticing for your searchers to click on, and accurately represents your content to avoid bounces or heavy re-writing by the Search Engine. You should keep these factors in mind when populating the page Title, Meta Description and URL.

Hreflang Usage

Your page is not making use of Hreflang attributes.

Hreflang is an HTML attribute used to specify the language and geographical targeting of a page. It is commonly used together with the 'alternate' attribute in the code of a page to signal to Search Engines a list of alternative language or geographic versions of the current page.

If you have multiple versions of the same page in different languages, it is important to add Hreflang tags to tell Search Engines about these variations. This code may need to be manually added into the HTML code of your page, but is also often controlled by your CMS or plugin system if multi-lingual features are enabled.

Language

Your page is using the Lang Attribute.

Declared: English

The Lang Attribute is used to describe the intended language of the current page to user's browsers and Search Engines. Search Engines may use the Lang Attribute to return language specific search results to a searcher, and in the browser, Lang Attribute can signal the need to switch to a different language if it is different to the user's own preferred language.

We recommend adding the Lang Attribute to the HTML tag of every page to avoid any chance of misinterpretation of language. This may need to be manually added to the site's HTML code, or may be controlled by your CMS.

H1 Header Tag Usage

Your page has a H1 Tag.

TAG	VALUE
H1	The Crime &Society Review

The H1 Header Tag is one of the most important ways of signaling to Search Engines the topic of a page and subsequently the keywords it should rank for. The H1 Tag normally appears as visible text in the largest font size on the page.

We recommend adding a H1 Header Tag near the top of your page content and include important keywords you would like to rank for. You should have one, and only one H1 tag on each page. If you are using a CMS, this would normally be entered into the core content section of the page.

H2-H6 Header Tag Usage

Your page is making use multiple levels of Header Tags.

HEADER TAG	FREQUENCY
H2	2
H3	3
H4	42
H5	0
H6	0

The H2-H6 Header Tags are an important way of organizing the content of your page and signaling to Search Engines the longer tail topics your page should rank for.

We recommend including at least 2 other Header Tag levels on your page (such as H2 and H3) in addition to the H1. It is useful to also include important keywords in these Header Tags. These would be added to the core content section of your page.

Heading Structure

We found issues with the heading structure of your page.

We identified 2 skipped heading levels.

A logical heading outline helps search engines and LLMs understand how your content is organized.

H1 The Crime &Society Review

H2 Interdisciplinary Pillars: Law, Forensics & Society

H4 Criminology Skipped Level

H2 Global ScholarlyResearch Network
H4 Journal Directory Skipped Level
H4 Scholarly Standards

Heading tags should form a logical outline of the page: levels should not skip downwards (an H2 followed directly by an H4), and every heading should contain actual text. Search engines and LLMs use the heading hierarchy to understand how your content is organized, and screen readers use it for navigation - a broken outline makes the page harder to parse for both.

Structure headings sequentially: the page title as H1, main sections as H2, subsections as H3, and so on. Never pick a heading level for its font size - style it with CSS instead. Remove or fill any headings that contain no text, and give image-only headings alt text so the image can act as the heading.

Keyword Consistency

Your page's main keywords are distributed well across the important HTML Tags.

KEYWORD	TITLE	META DESCRIPTION TAG	HEADINGS TAGS	PAGE FREQUENCY	
society review	✓	✗	✓	3	
journal	✓	✓	✓	6	
criminal law	✗	✗	✗	3	
crime	✓	✓	✓	8	
interdisciplinary	✓	✓	✓	3	
forensic science	✗	✗	✓	2	
criminal justice	✗	✗	✓	2	
crime prevention	✗	✗	✓	2	

A page should be targeted to rank for a particular set of keywords or phrases, and those terms should be used with some consistency in the page content (naturally and without stuffing) to maximize its ranking potential. This check identifies the terms your page appears to be targeting - the words and multi-word phrases used most prominently and frequently in the content - and shows whether each one also appears in the page's most important HTML Tags: the Title, Meta Description and Header Tags.

Review the identified terms against your intended ranking keywords. If a term you want to rank for is missing, or does not appear in the Title, Meta Description or Header Tags, consider amending your page content and those tags to include it more consistently.

Amount of Content

Your page has a low volume of text content which search engines can interpret as 'thin content'.

Word Count: 716

It has been well researched that higher text content volumes are related to better ranking ability in general.

Numerous studies have shown that there is a relationship between the amount of content on a page (typically measured in word count) and it's ranking potential - generally longer content will rank higher. Obviously content also needs to be topically relevant, keyword rich and highly readable for the visitor. Note, in our assessment, we look at all selectable text on the page at load time, not hidden content.

As a general guideline, it is recommended to have atleast 500 words of content on a page to give it some ranking potential. However this should be considered on a case by case basis. It may not be relevant for particular pages like 'contact us' pages for example.

Image Alt Attributes

You do not have any images missing Alt Attributes on your page.

Alternate Image Text or Alt Text is descriptive text that is displayed in place of an image if it can't be loaded, as well as a label on an image when it is moused over in the browser, to give more information to the visitor. Additionally, Search Engines use provided Alt Text to better understand the content of an image. Image SEO is not widely known, but having your image rank for image searches is an overlooked way of gaining traffic and backlinks to your site.

We recommend adding useful and keyword rich Alt Text for pages's main images, in particular those that could have ranking potential. This should be considered on a case-by-case basis. Often there may be imagery such as UI components or tracking pixels where it may not be useful to add Alt Text, though we have tried to filter a number of these out in our analysis.

Canonical Tag

Your page is not using the Canonical Tag.

The Canonical Tag tells Search Engines the primary URL of a page. Google recommends all pages specify a Canonical.

The Canonical Tag is a HTML Tag that tells Search Engines the primary URL of a page. URLs can have multiple versions due to things like parameters being passed or www and non-www versions, resulting in potential duplicate content. Google recommends all pages specify a Canonical for this reason.

You may need to determine what the primary preferred version of the page is. Often the CMS may manage this, or provide the ability to specify it.

SSL Enabled

Your website has SSL enabled.

SSL or Secure Socket Layer, is a security technology that encrypts data between your website and a visitor. It ensures that the transfer of sensitive data like passwords and credit cards are done securely. Using SSL on all pages is a modern standard, and Search Engines have made it a ranking signal in recent years.

SSL can often be switched on quite simply in systems like Wordpress, Wix etc. Often in more custom websites though, it may require the help of a technical resource to install and configure this on your website. After installation, test that your website loads successfully at a HTTPS:// location.

HTTPS Redirect

Your page does not redirect to a HTTPS (SSL secure) version.

SSL is a security technology which ensures sensitive data like passwords and credit cards are sent securely between your website and visitors. If you have SSL enabled, it is also very important to ensure that your page is actually forcing usage of HTTPS by redirecting from a non-secure HTTP version to secure HTTPS version. Not doing this means users and Search Engines may continue to access insecure versions, which can also reduce your ranking ability.

Often systems like Wix or Shopify will make it easy to enable, and redirect to SSL versions. If you have Wordpress, or a custom built site, you may require a developer's involvement to ensure that pages are being redirected to their new HTTPS versions. This can be done within a site's configuration or htaccess rules.

Robots.txt

Your website appears to have a robots.txt file.

http://thecsrjournal.com/robots.txt

Robots.txt is a text file that provides instructions to Search Engine crawlers on how to crawl your site, including types of pages to access or not access. It is often the gatekeeper of your site, and normally the first thing a Search Engine bot will access.

We recommend always having a robots file in place for your site. These can be automatically created using a free online utility, Wordpress plugin, or your CMS's robots.txt creation process.

Search Engines Blocked by Robots.txt

Your page is crawlable by the major search engines.

The robots.txt file includes important instructions to Search Engines on how to crawl a site, including instructions to ignore particular pages (effectively 'blocking' them). Sometimes these instructions are added intentionally for low value pages, but sometimes they are left over by mistake when a website goes live, or can be written incorrectly excluding more pages than desired.

If you want the page to rank and it's blocked by a rule in robots.txt, you may need to review your robots rules to understand why it's being blocked, and remove the rule. Because robots.txt instructions are a type of code, this may require the help of a developer to correct.

Noindex Tag Test

Your page is not using the Noindex Tag which prevents indexing.

A critical part of a page's ranking potential is ensuring that it can actually be accessed by Search Engines. The Noindex Tag, when used on pages, tells Search Engines to ignore a page, and can destroy out it's ranking ability. Sometimes these tags are added intentionally for low value pages, but sometimes they are left over unintentionally from a theme or template that has been used on the site, or forgotten to be removed by a developer when a website moves from design and testing to live usage.

If you want the page to rank and it's using a Noindex Tag, you will need to remove the tag from your page's HTML entirely. This may require access to the frontend HTML code, and may need to be done by a developer. If you are using a CMS, you may have an option enabled to prevent indexing of the page, which should be turned off.

Noindex Header Test

Your page is not using the Noindex Header which prevents indexing.

A critical part of a page's ranking potential is ensuring that it can actually be accessed by Search Engines. The Noindex Header is another Noindexing method that tells Search Engines to ignore a page, and can destroy out it's ranking ability. Sometimes these tags are added intentionally for low value pages, but sometimes they are left over unintentionally from a theme or template that has been used on the site, or forgotten to be removed by a developer when a website moves from design and testing to live usage.

If you want the page to rank and it's using a Noindex Header, you will need to remove the Noindex Header from your page. This may require access to the backend code, and may need to be done by a developer. If you are using a CMS, you may have an option enabled to prevent indexing of the page, which should be turned off.

XML Sitemaps

We have not detected or been able to retrieve a XML Sitemaps File successfully.

Sitemaps are recommended to ensure that search engines can intelligently crawl all of your pages.

A Sitemap is an XML data file on your site that lists all of your site's pages that are available for crawling together with other useful information like last update times and crawling priority. Sitemap files help Search Engines find all your pages to give them the highest chance of being indexed and ranked.

We recommend always having a Sitemaps file in place for your site. Sitemaps can be created manually using a utility, Wordpress plugin, or your CMS's Sitemap creation process. Additionally, the Sitemap should be referenced in your robots.txt file.

Analytics

Your page is using an analytics tool.

Cloudflare Web Analytics

Web Analytics Tools like Google Analytics allow you to analyze your website's performance and understand your visitors better.

We recommend using an analytics tool on your site. Analytics tracking code can be installed manually into page code with the help of a developer or enabled as a feature of your CMS.

Schema.org Structured Data

We have not detected any usage of Schema.org on your page.

Schema.org is a structured data markup for webpages which helps Search Engines understand your site better and provide rich snippets directly in their search results.

Schema.org Structured Data Markup is a collection of data tags that can be added to your site to allow Search Engines to more easily interpret the content and use it to enhance Search Results. For example there are tags for providing information about your Local Business such as address and phone number, or adding product information on e-commerce pages so that these products can be displayed in shopping aggregators like Google Shopping.

It is a good idea to start incorporating some relevant Schema.org tags into your site to improve interpretation and display by Search Engines.

Generative Engine Optimization (GEO)

Your Generative Engine Optimization could be better

Your page has some level positioning for Generative Engine Optimization (GEO). GEO is important to ensure LLMs and AI Search Engines can effectively crawl your content and understand the underlying entity structure. Consider additional enhancements to improve visibility in LLMs as this is becoming a rapidly growing traffic source.

Rendered Content (LLM Readability)

Your page has a high level of rendering (changes to the HTML).

Rendering Percentage: 3351%

Dynamically rendering a lot of page content risks some important information being missed by LLMs that generally do not read this content.

LLMs and AI Crawlers predominantly read the raw HTML of a website instead of the completed, dynamically rendered HTML produced in a web-browser, that may have been updated by Javascript. This stems from LLMs being naturally optimized to parse static content like documents and files as well as the fact that rendering website Javascript at scale is expensive, slow, and can be less consistent.

You should ensure that important site content is always present in the raw HTML of your site and minimize the usage of plugins and Javascript components known to add content dynamically. This requires a moderate technical understanding to achieve and test.

Llms.txt

Your website appears to have a llms.txt file.

Llms.txt is a proposed standard for websites to guide large language models (LLMs) to better understand your site's content.

http://thecsrjournal.com/llms.txt

Llms.txt is a proposed standard file for websites to help large language model (LLM) crawlers understand a site's content more efficiently. The file offers brief background information, guidance, and links to documentation sources.

We suggest adding a llms.txt markdown file to your site. This can be automatically created with a free utility, plugin, or by your website CMS automatically.

AI Crawlers Blocked by Robots.txt

Your robots.txt allows the major AI crawlers to access your site.

Generative engines like ChatGPT, Google AI Overviews, Perplexity and Claude use their own crawlers to read and cite web content. If your robots.txt blocks these AI crawler user-agents, those engines cannot access your pages and are far less likely to surface or cite your business.

Review your robots.txt for Disallow rules that target AI crawler user-agents (such as GPTBot, Google-Extended, ClaudeBot, PerplexityBot and CCBot). If you want to be visible in AI answers, remove those rules so the crawlers can access your content.

Entity Definition

Your page clearly defines the entity it represents.

The page clearly identifies The Crime & Society Review as an interdisciplinary journal covering criminology, forensics, criminal law, and societal justice.

LLMs and AI Search Engines need to clearly identify the entity (business, organization, or person) a page represents in order to attribute, trust and recommend it confidently.

Make the entity name and what it does prominent and unambiguous through clear headings, an intro or about section, and consistent naming, so both people and AI can identify who you are.

Contact Transparency

Your page provides business details and contact points, though these could be more complete.

The page provides Contact Us navigation and official LinkedIn, X, and Instagram channels, but no direct address, phone, or email.

Explicit business details such as legal name, registration numbers, address and contact methods build trust and help AI verify, attribute and cite the business.

Publish clear company and contact information (name, address, phone, email, and registration or VAT numbers where applicable), typically in the footer and on a dedicated contact page.

Answer Alignment

Your page lacks question-and-answer style content such as an FAQ.

The page presents descriptive headings and navigation links, but contains essentially no explicit question-and-answer or FAQ content.

Content in explicit question-and-answer format (such as an FAQ) maps directly to the queries people ask LLMs, making it easier for your content to be surfaced and cited.

Add an FAQ section, or structure relevant content as clear questions with concise, self-contained answers beneath them.

Citation Readiness

Your page contains easily citable facts, quotes or statistics.

The page includes numerous self-contained descriptions of research domains, publishing standards, submission requirements, and the journal's scholarly purpose.

Self-contained, factual snippets such as statistics, quotes and data points are the kind of content LLMs prefer to quote and cite when answering questions.

Include concrete facts, statistics and quotable statements written as clear, self-contained sentences that still make sense when cited on their own.

Content Structure

Your page is well structured and easy for AI to parse.

The page is highly scannable, using clear headings, numbered subject areas, concise cards, navigation, and visually separated content sections.

Well-structured, scannable content - with clear headings, lists and short paragraphs - is far easier for LLMs to parse, chunk and reuse when answering questions.

Break content into a clear heading hierarchy with sub-headings, bulleted or numbered lists, tables and short digestible paragraphs rather than dense blocks of text.

Content Freshness

Your page shows recency signals, though it could indicate freshness more strongly.

The page displays a 2026 copyright year and current publication claims, but lacks a specific publication or update date.

Generative engines favour content that appears current. Visible recency signals such as dates and recent information make your page more likely to be surfaced and cited.

Show publish or "last updated" dates, reference the current year and recent information, and keep details such as prices and events up to date.

Authority & Trust Signals

Your page shows authority and trust signals, though these could be stronger.

The page presents double-blind peer review, open access, editorial and advisory boards, scholarly standards, and social channels, but no named credentials or awards.

LLMs prefer to cite sources that appear credible. Visible authority and trust signals - author credentials, certifications, awards, trust badges and press mentions - make your page a more citable source.

Surface author names and credentials, certifications, awards, recognisable trust badges, press or "as featured in" mentions, and cite your sources.

Links

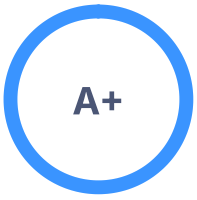

Descriptive Anchor Text

The internal links on your page appear to use descriptive anchor text.

Anchor text is the visible, clickable text of a link. Search engines use it to understand what the destination page is about, so descriptive anchors like "pricing plans" pass far more relevance than generic ones like "click here" or "read more". Links with no text at all (for example unlabeled icon links) pass no signal and are also unusable for screen reader users, and raw URLs used as the visible text are hard to read and waste the same opportunity.

Rewrite generic anchors to describe the destination page, ideally using its target keywords naturally. Give icon-only links an accessible name via image alt text or an aria-label, and replace raw URLs shown as link text with a readable phrase.

Usability

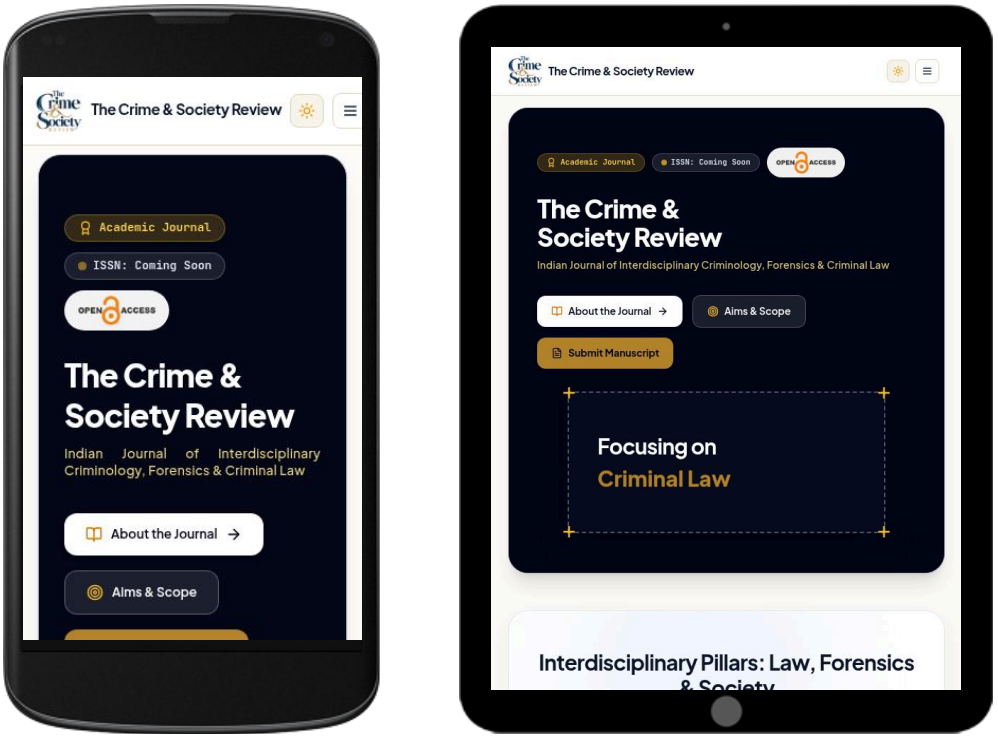

Your usability is very good!

Your page is highly usable across devices. Usability is important to maximize your available audience and minimize user bounce rates (which can indirectly affect your search engine rankings).

Device Rendering

This check visually demonstrates how your page renders on different devices. It is important that your page is optimized for mobile and tablet experiences as today the majority of web traffic comes from these sources.

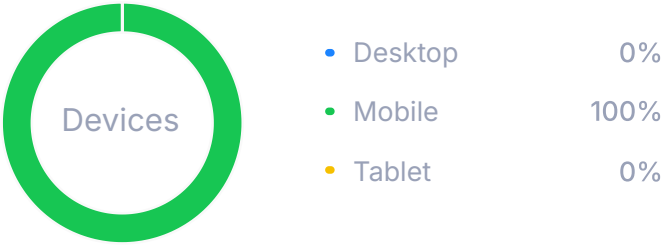

A website can be viewed in a wide variety of resolutions and formats, some dictated by the size of a desktop display, and others by the specific dimensions of a phone or tablet model. Device rendering provides a preview of how the site looks on some popular device resolutions to help identify obvious issues. Note, our method will load a website and resize it's portlet to several dimensions, as opposed to loading the site multiple times directly in different devices.

In general a website should be designed and tested to be responsive across a large variety of desktop and mobile device resolutions, as well as being able to transition smoothly (for example when resizing a browser or flipping a tablet from vertical to horizontal).

Device Usage

0.0% of your visitors browse your site on desktop devices, 100.0% on mobile and 0.0% on tablet.

Source: Google's official sampling of real Chrome visitors over the last 28 days, which excludes iPhones and iPads and so may differ from your own analytics.

The Chrome UX Report records which device types real visitors use to browse your site - desktop, mobile or tablet. Knowing your actual audience split helps prioritize optimization work: a site with mostly mobile visitors should weight mobile experience metrics far more heavily, while a heavily desktop audience may justify different design decisions.

There is nothing to fix here - use this breakdown to decide where to focus. If mobile is a meaningful share of your traffic, prioritize the mobile PageSpeed, viewport and tap target results in this report.

Use of Mobile Viewports

Your page specifies a Viewport matching the device's size, allowing it to render appropriately across devices.

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

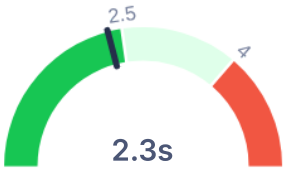

The Viewport is a Meta Tag within the page's HTML which gives the browser instructions for how to control the page's dimensions and scaling. Setting the Viewport is particularly important for mobile and tablet device responsiveness, as without it, the page can appear incorrectly sized and require zooming or scrolling to view content.

Make sure you include one Meta Viewport tag in the Head section of page HTML.

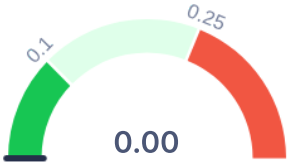

Google's Core Web Vitals

Your page has passed Google's Core Web Vitals assessment.

Largest Contentful Paint (LCP)

Cumulative Layout Shift (CLS)

Core Web Vitals are UI Metrics designed by Google that measure the overall quality of user experience on your site. They assess things such as the appearance of content, interactivity of the page and visual stability from the moment of page load. Core Web Vitals are gathered from real world usage data of a website (hence some smaller websites that haven't been well sampled may not return an appropriate result). Google has made Core Web Vitals a ranking factor for pages with increasing importance.

To improve your Core Web Vitals scores, you may need to read Google's documentation on the topic and follow the recommendations provided in the Google's PageSpeed Insights assessment.

Flash Used?

No Flash content has been identified on your page.

Flash is an old embedded website technology that was frequently used in heavily animated features such as games and videos. However, Flash is not supported by all mobile devices and is not easily read by search engines. Improvements to HTML and CSS and the increased speed of modern web browsers have made it possible to implement many similar features with standard web technologies.

If Flash is detected on your site, you should carefully consider whether it is necessary due to the several drawbacks.

iFrames Used?

There are no iFrames detected on your page.

iFrames are a HTML tag that allow you to embed other webpages inside your page in a small frame. They generally represent an older coding practice and are discouraged as they can complicate navigation, particularly in mobile, and are harder for search engines to index.

We recommend removing any iFrames if they don't serve a critical purpose, or could be replaced with more natural navigation. However, some coding libraries like Google Tag Manager may still rely on iFrames as part of their internal functionality to load external pages and code files, so you may need to evaluate your usage of them on a case by case basis.

Favicon

Your page has specified a Favicon.

https://thecsrjournal.com/logo.png

A Favicon is a small icon that serves as branding for your website. It's main purpose is to help visitors locate your page easier when they have multiple tabs open. It adds legitimacy to your site and helps boost your online branding as well as trust from potential consumers.

Either use an online Favicon builder tool, or a graphic designer to build your Favicon, and load them into your website or CMS.

Email Privacy

No email addresses have been found in plain text on your page.

Email addresses shown in clear text on your website can be easily scraped by bots, leading to inclusion in spam mailing lists.

We recommend removing any plain text email addresses and replacing them with contact forms, images, or less obvious text like 'email at website'.

Performance Results

A+

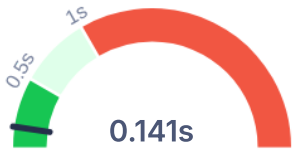

Your performance is very good!

Congratulations, your page has performed very well in our testing meaning it should be reasonably fast and responsive for users. Performance is important to ensure a good user experience, and reduced bounce rates (which can also indirectly affect your search engine rankings). Continue to monitor your performance over time to ensure there are no periodic fluctuations.

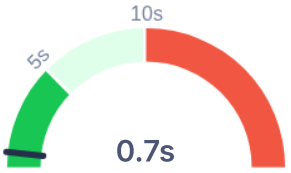

Website Load Speed

Your page loads in a reasonable amount of time.

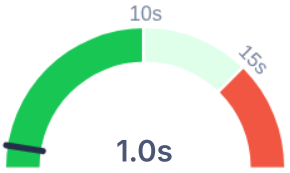

Server Response

All Page Content Loaded

All Page Scripts Complete

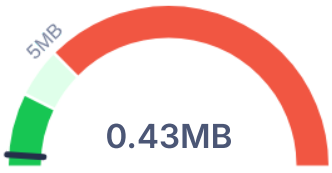

Page Load Speed refers to the amount of time it takes to entirely load a webpage in a user's browser. Load speed is complex and can be impacted by a multitude of factors including network, web server, page size, technology, database or coding problems, and may require the help of a developer or systems administrator to troubleshoot. Page Load Speed impacts a user's experience on a website and can directly impact bounce rate and conversions. Additionally, Search Engines are making Page Load Speed a ranking factor.

Optimize Page Load Speed by examining common problem points such as overall file size, server resources or coding problems.

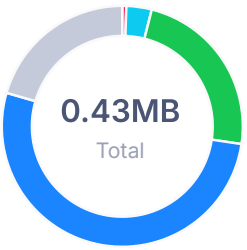

Website Download Size

Your page's file size is reasonably low which is good for Page Load Speed and user experience.

Download Page Size

Download Page Size Breakdown

HTML	0MB
CSS	0.01MB
JS	0.1MB
Images	0.23MB
Other	0.09MB

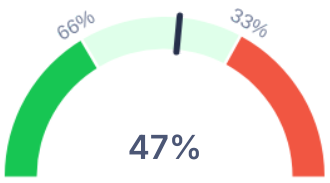

Download Page Size refers to the total amount of file content that needs to be downloaded by the browser to view a particular webpage. This includes HTML, CSS, Javascript and Images, though can include a number of other file formats. Generally media files like images and videos are significantly larger than text files and make up the bulk of Download File Size, but also represent the largest optimization opportunity. An important distinction here is 'Download' vs 'Raw' file size. Modern web protocols compress files during transfer, meaning files are usually smaller to download than their actual or 'raw' size. So any manual optimizations you perform would be on the 'raw' file. Download Page Size is one of the biggest contributors to Page Load Speed, which can directly affect rankings, user experience and conversions.

It is important to ensure your Download File Size is as small as possible by removing unnecessary files and minifying and optimizing others. 5MB is a good metric to strive for, though modern websites are gradually increasing in size.

Compression Usage (Gzip, Deflate, Brotli)

Your website appears to be using a reasonable level of compression.

Compression Rate

Compression Rates

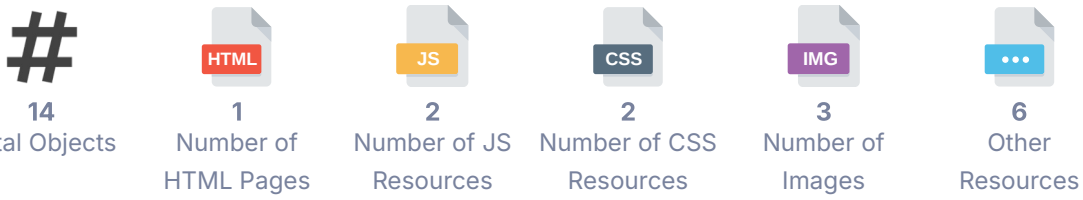

HTML		**34%** compressed of 0.00MB
CSS		**83%** compressed of 0.09MB
JS		**67%** compressed of 0.31MB
Images		**31%** compressed of 0.33MB
Other		**0%** compressed of 0.09MB
Total		**47% compressed of 0.81MB**

Modern web servers allow website files to be compressed as part of their transfer, often dramatically reducing the Download File Size and Page Load Speed of a page. There are several different compression algorithms used such as GZIP, Deflate and Brotli. Enabling compression can often represent a simple and quick win to performance, and most new web servers will have this enabled by default.

You should ensure that compression is enabled and working effectively on your web server. Sometimes compression may only be partially enabled for particular file types, or using an older compression method, so it is important to understand whether your server is configured as efficiently as possible. This may require the help of a developer to investigate.

Resources Breakdown

This check displays the total number of files that need to be retrieved from web servers to load your page.

14	1	2	2	3	6
Total Objects	Number of HTML Pages	Number of JS Resources	Number of CSS Resources	Number of Images	Other Resources

When browsers display a modern website, they have to retrieve a wide variety of files including HTML, CSS, Javascript, Images and other media. As a general rule, every file that needs to be retrieved is another network request that needs to be made by the browser to the server, which can each face some connection overhead and add to Page Load Time.

It is a good idea to remove unnecessary files or consolidate smaller files with similar content like styles and scripts where possible to optimize performance.

JavaScript Errors

Your page is not reporting any JavaScript errors.

JavaScript is embedded code on a webpage that can perform any number of functions such as modifying page elements dynamically, or making calls to retrieve information live without refreshing the page. JavaScript is a staple of the modern web and used on almost every modern website. However, with increasing usage and complexity, Javascript can fail on a page due to coding problems, incorrect versions or loading issues. Sometimes failures can interrupt proper execution of a page and break other functions, and so Javascript errors should generally be examined to understand the cause and what it's impacts are .

HTTP2 Usage

Your website is using the recommended HTTP/2+ Protocol.

HTTP is a technology protocol used by web browser to communicate with websites and is a cornerstone of the world wide web. HTTP/2 (and above) are newer versions of the HTTP protocol that offer significant performance improvements. Older websites may be set to using an older HTTP protocol despite their web servers having been upgraded to support newer versions.

It is worth reviewing whether your website is configured to use the latest available HTTP protocol as it can provide immediate Page Load Speed improvements.

Deprecated HTML

No deprecated HTML tags have been found within your page.

HTML, like most coding languages, has had improvements made over time that has removed older features, either due to them simply being problematic, or more often replaced with something better. If you continue to use these older features in your page, you may at the bare minimum not get the expected functionality in your page, or in the worst case, break some execution.

It is recommended to identify and remove any old or 'deprecated' tags from your code. This could be done manually if you have HTML or web design skills, or could be done by upgrading the template and library versions on your website.

Inline Styles

No Inline Styles have been found within your page's HTML tags.

HTML provides the ability to embed UI styling attributes within individual HTML elements. Despite this feature being available, it is modern best practice to completely separate UI styling into separate CSS files. This separates functions and centralises UI styling into one place making it easier for example to upgrade the UI styling of a site independently of the page content and structure. Inline Styles also have some particular problems in that they can degrade the page load performance of a page and unnecessarily complicate HTML code.

Inline Styles should be manually removed from the HTML code of a page and merged into separate CSS files, but may need the help of a designer to carefully consider their purpose and function.

Social Results

Facebook Page Linked

No associated Facebook Page found as a link on your page.

Creating Social Profiles as well as linking to these from your website can help to build trust in your business and provide other mediums to nurture your customer relationships.

We recommend creating all common Social Profiles and linking to these from your website. Most CMS systems will offer fields to enter your Social Profile URLs and will display these in a button row section in the footer.

Facebook Open Graph Tags

We have not found Facebook Open Graph Tags on your page.

Facebook Open Graph Tags are a type of structured data that can be placed on your page to control what content is shown when a page is shared on Facebook.

Facebook Open Graph Tags are a type of structured data that can be placed on your page to control what is shown when your page is shared on Facebook. You can indicate exactly what content should appear in a sharing snippet's title, description, imagery and other information. This is useful when pages like your homepage, products or articles are shared, and effective sharing can drive traffic and conversions. You may want to ensure that the content presented is correct and has the highest chance of attracting visitors. If you don't define specific content, Facebook may decide automatically which pieces of text and imagery are displayed which may not always be correct or appealing.

We recommend defining as many of Facebook's Open Graph fields as possible, and inserting this code into the HTML of your page. Facebook has a helper tool for creating this content, or sometimes it can be written automatically with the help of a CMS plugin.

Facebook Pixel

We have not detected a Facebook Pixel on your page.

Facebook's Pixel is a useful piece of analytics code that allows you to retarget visitors if you decide to run Facebook Ads in future.

Facebook Pixel is a piece of analytics code that allows Facebook to capture and analyse visitor information from your site. This allows you to retarget these visitors with Facebook messaging in future, or build new 'lookalike' audiences similar to your existing visitors.

In can be a good idea to install a Facebook Pixel if you intend to do any Facebook related marketing in the future in order to prepare audience data.

X (formerly Twitter) Account Linked

Your page has a link to a X Profile.

https://x.com/the_csrjournal

X Cards

We have not detected X Cards on your page.

X Cards are a type of structured data that can be placed on your page to control what content is shown when a page is shared on X.

Similar to Facebook Open Graph Tags, X Cards are a type of structured data that can be placed on your page to control what is shown when your page is shared on X. You can indicate exactly what content should appear in a sharing snippet's title, description, imagery and other information.

We recommend defining as many of X`s Cards as possible, and inserting this code into the HTML of your page. X has a cards markup tool for creating this content, or sometimes it can be written automatically with the help of a CMS plugin.

Instagram Linked

Your page has a link to an Instagram Profile.

https://instagram.com/the_csrjournal

LinkedIn Page Linked

Your page has a link to a LinkedIn Profile.

https://linkedin.com/company/146605282

YouTube Channel Linked

No associated YouTube Channel found linked on your page.

YouTube Channel Activity

No associated YouTube Channel found linked on your page.

Local SEO

Address & Phone Shown on Website

We can't identify one or both of these components on the page. Missing: Phone, Address

Address & phone number are key pieces of information for customers to contact a local business. However they also help Google identify that the website represents a particular local business to build a complete online profile helping it rank in local search results.

Ensure that your full business address and phone number are correct and clearly visible in clear text on the site and not hidden behind expanders or text that could load dynamically.

Local Business Schema

No Local Business Schema identified on the page.

Local Business Schema is a type of structured data markup that can be added to the code of a webpage. Adding accurate Local Business Schema categories helps Search Engines more understand your website and the business it represents so that it can rank in local search results.

The approach for adding Local Business Schema depends on your website's capabilities. Your CMS may have the ability to input this directly, or you may need to install a Schema app or plugin. Alternatively you can manually create your Schema through the use of an online Schema Generator tool and copy this into the code of your site.

Google Business Profile Identified

No Google Business Profile was identified that links to this website.

A Google Business Profile (GBP) is a listing representing your business that appears in Google Maps or standard Google Searches that have local intent. GBP contains key information about the business such as name, location, contact information, opening hours as well as customer ratings and reviews. GBP is an important tool for local businesses to manage their online presence, reach customers on Google, and compete against other similar businesses.

If you are a local business, it is important to create your Google Business Profile (or claim it if one has been automatically created by Google) and update the details as completely and accurately as possible. We try to identify your GBP based on the website URL listed in the profile matching the one in this audit. If your GBP profile exists but we can't identify it, you may want to check that the website URL is correct.

Google Business Profile Completeness

No Google Business Profile was identified that links to this website.

It is important your Google Business Profile (GBP) details are complete and correct - in particular those referred to as the 'NAP' - Name, Address Phone. This obviously helps local customers find your business, but also aids local SEO by helping Google accurately identify online citations of your business to understand the online presence, trust and reputation of your business.

We recommend reviewing the details of your business's Google Business Profile and updating it as completely and accurately as possible.

Google Reviews

No Google Business Profile was identified that links to this website.

Google reviews and ratings are critical for a business - they can directly impact customer trust and reputation of your business which drives foot traffic, but are also a ranking signal Google uses to determine how to rank your business in local search results.

Be pro-active in trying to drive reviews for your business (there are multiple methods and online tools to assist) as well as responding to any negative feedback.

DMARC Record

This site does not appear to have a DMARC record in place.

DMARC records are important to improve email deliverability and combat spoofing.

DMARC (Domain-based Message Authentication, Reporting, and Conformance) is a DNS record that can be added for a site to help prevent email spoofing from malicious parties. It is more frequently being adopted as a mailing requirement by email providers like Google and can affect deliverability rates if not in place.

We recommend reviewing the documentation from both your email delivery platform as well as common recipient platforms like Gmail and Outlook to determine the appropriate DMARC records and how to implement this into your site's DNS

SPF Record

This site does not appear to have an SPF record.

SPF records are important to improve email deliverability and combat spoofing.

An SPF (Sender Policy Framework) record is a DNS record that is set to identify mail servers and domains that are allowed to send email on behalf of your domain and is designed to help combat email spoofing.

We recommend reviewing the documentation of all the delivery platforms you use to determine the appropriate SPF records to implement for your site to ensure highest deliverability.
